INTRODUCTION

The idea of creating the «Dictionary of Health Science Terminology» in the Greek and English language is a result of cooperation between experts of Nursing Science and Associates, and comes to offer its help in translation from Greek to English. The dictionary is aimed at undergraduate students of nursing science and aims to cover basic Nursing needs, to be a handy and useful tool, and a code to the acquisition of common interdisciplinary language among nurses.

We do not aspire to replace any of the good dictionaries of nursing, medical and biological terms, but we try to fill the gap in translation needs of our students.

The dictionary consists of three parts:

* The first part, which is divided into five sections according to the letters of the Greek alphabet, will include a brief description of the most commonly used terms in Nursing in Greek and English
* The Glossary I, which include the most frequently used contractions and
* In the third part, there will be Greek to English Public Health terminology

The dictionary will be updated at regular intervals.

With the hope that the «Dictionary of Health Science Terminology» will become a necessary tool for our students, we expect your comments, your feedback and your support.

Organization and Design

Fotoula Babatsikou, Associate Professor of Nursing

January 2015
